

PROGRAMMING PROJECT

COURSES CODE & NAME

PROGRAMMING (K_BCS_004)

FACULTY

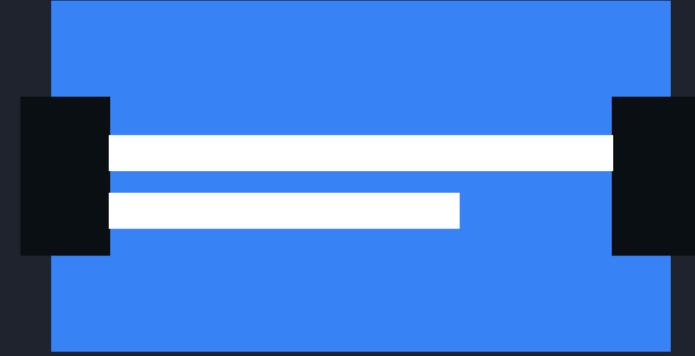

SCHOOL OF TECHNOLOGY AND ARC

STUDENTS NAME & MATRIC NUMBER

- 1.NUR ALEESA RIZAL (100007381)
- 2.CHARVI SHARMA (100006734)
- 3.DEV CHAUDHARY (100006200)
- 4.PALAKSHA BORA (100007676)
- 5.DAKSH PATEL (100007931)

LECTURERS' NAME

PROFESSOR PAUL
TANZER PROFESSOR
PETER DILLINGER

Parking Management System

Desktop Client + REST Backend

Java Swing • Spring Boot • MySQL • JPA/Hibernate

Project Overview

Search Feature

Admin searches for specific car plates using the search bar. Table filters to show only matching results after clicking Apply.

Filter & Sort

Filter by vehicle type (CAR, BIKE, TRUCK, OTHER). Sort by Exit Time, Entry Time newest/oldest, or Car Plate A-Z / Z-A.

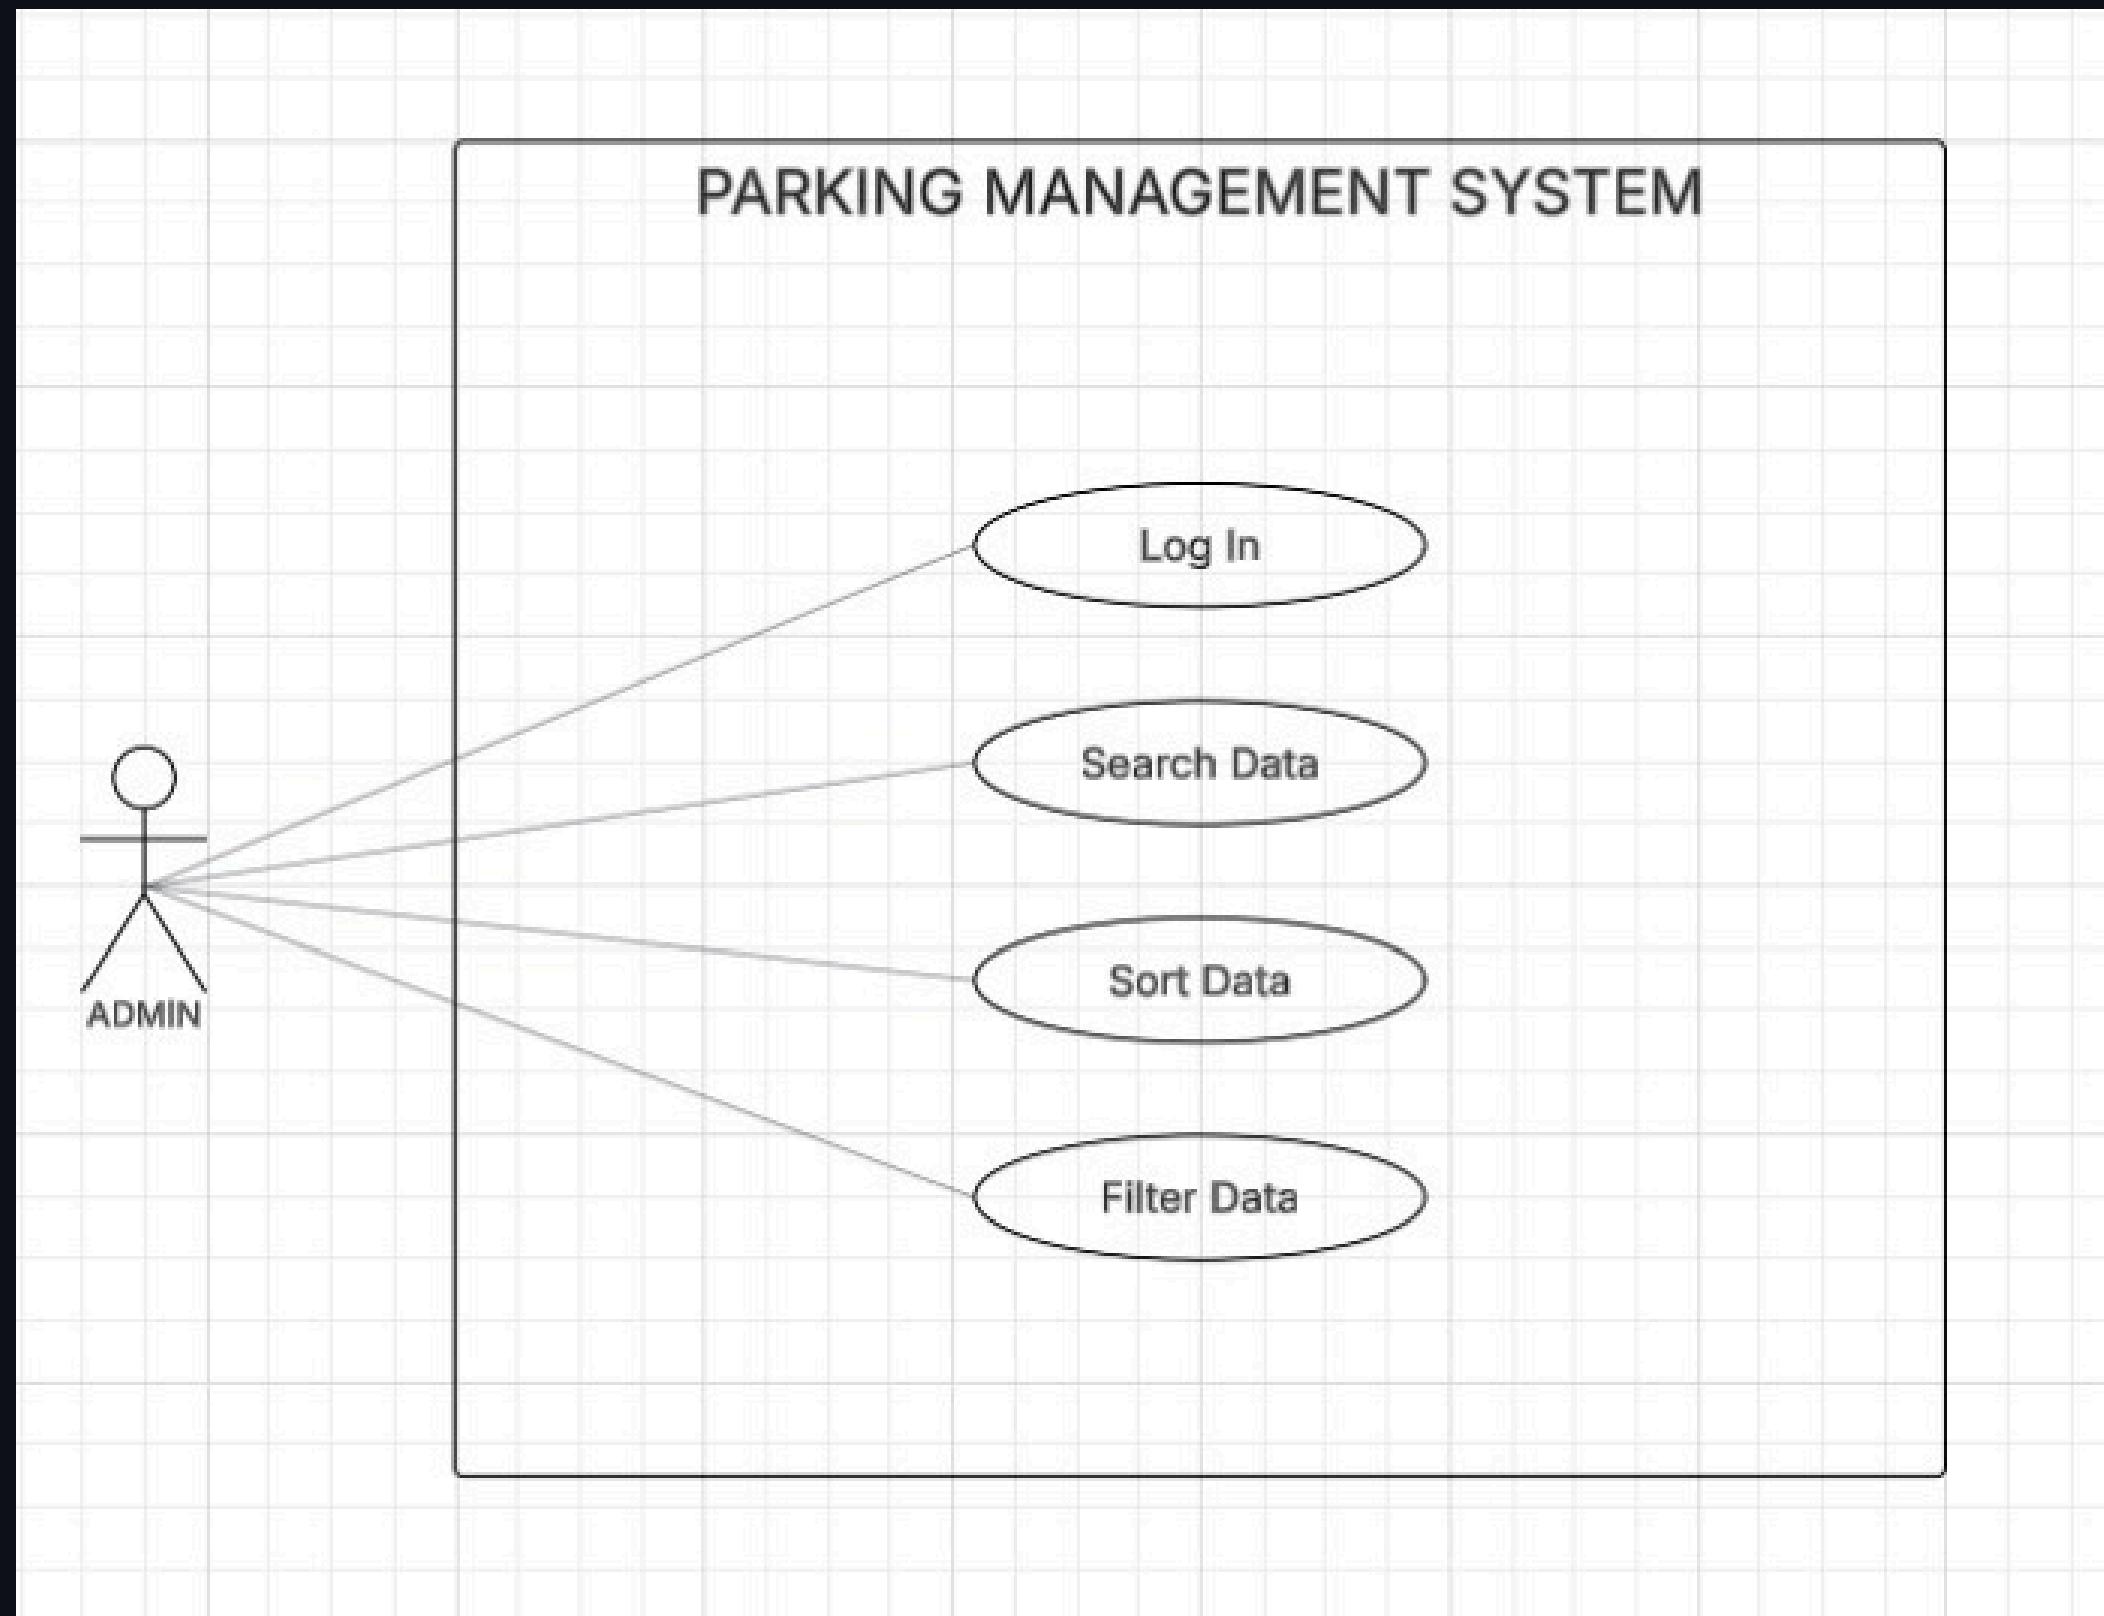

History Data View

Full table of all CLOSED tickets — ID, Plate, Type, Status, Entry Time, Exit Time, Amount. Shows the complete parking record.

Persistent MySQL Storage

All ticket data stored in MySQL database — survives restarts. Amount auto-calculated via a GENERATED column formula.

System Architecture – Use Case Diagram

Log In

Admin must authenticate before accessing the system.

Search Data

Admin searches for specific plate numbers in the table.

Sort Data

Admin sorts by Exit/Entry time or Car Plate A-Z.

Filter Data

Admin filters by vehicle type: CAR, BIKE, TRUCK, OTHER.

Tech Stack

Java + Swing

Programming Language & Desktop UI

Core language. Swing provides JFrame, JTable, JButton, ActionListeners, HttpClient, SwingWorker.

IntelliJ IDEA

Development IDE

Main IDE used to develop the system. Used as backbone — allows development in Java with Spring Boot plugin.

Spring Boot

REST Backend Framework

@RestController, @Service, @Transactional, Maven build tool.

MySQL Workbench

Database

Stores all ticket data. Allows adding, removing, editing and reading parking records.

GitHub — Version control. Holds all members' code contributions in one place.

MySQL – Tickets Table

Column	Type	Key Feature
<code>id</code>	<code>BIGINT</code>	PRIMARY KEY · AUTO_INCREMENT starts at 10001
<code>plate</code>	<code>VARCHAR(20)</code>	License plate — NOT NULL. Stored in uppercase.
<code>vehicleType</code>	<code>ENUM('CAR', 'TRUCK', 'BIKE')</code>	CAR / BIKE / TRUCK / OTHER — stored as String via @Enumerated
<code>status</code>	<code>ENUM('OPEN', 'CLOSED')</code>	OPEN when parked · CLOSED when exited
<code>entryTime</code>	<code>DATETIME</code>	DEFAULT CURRENT_TIMESTAMP — auto set on insert
<code>exitTime</code>	<code>DATETIME</code>	DEFAULT NULL · Set when car exits via manualExit()
<code>amount</code>	<code>DECIMAL(10, 2)</code>	GENERATED: ceiling(minutes ÷ 60) — read-only, insertable=false
<code>ticketID</code>	<code>VARCHAR(225)</code>	Customer-facing ID e.g. TKT-10001, set by @PrePersist

Spring Boot Backend – Layer Architecture

Controller Layer

@RestController

TicketApiController — Receives HTTP GET requests to /api/tickets, builds dynamic Specification, returns JSON list of tickets

1

Repository Layer

@Repository

TicketRepository extends JpaRepository + JpaSpecificationExecutor. Spring auto-generates SQL — no manual SQL written

2

Entity Layer

@Entity

Ticket.java maps to MySQL 'tickets' table. @PrePersist lifecycle hook auto-sets ticketID and default status = OPEN before INSERT

3

Spring Boot — REST API Endpoints

POST

/api/tickets/entry

```
{ "plate": "ABC123", "vehicleType": "CAR" }
```

Create new ticket — car enters parking

POST

/api/tickets/exit

```
{ "plate": "ABC123" }
```

Close ticket — car exits, fee auto-calculated by MySQL

GET

/api/tickets?status=OPEN

Returns: [{ id, plate, status, entryTime... }]

Get all currently parked vehicles (Live tab)

GET

/api/tickets?status=CLOSED&vehicleType=CAR&sort=exitTime,desc

Returns: [{ id, plate, exitTime, amount... }]

History with filters + sort (used by ParkingHistoryUI)

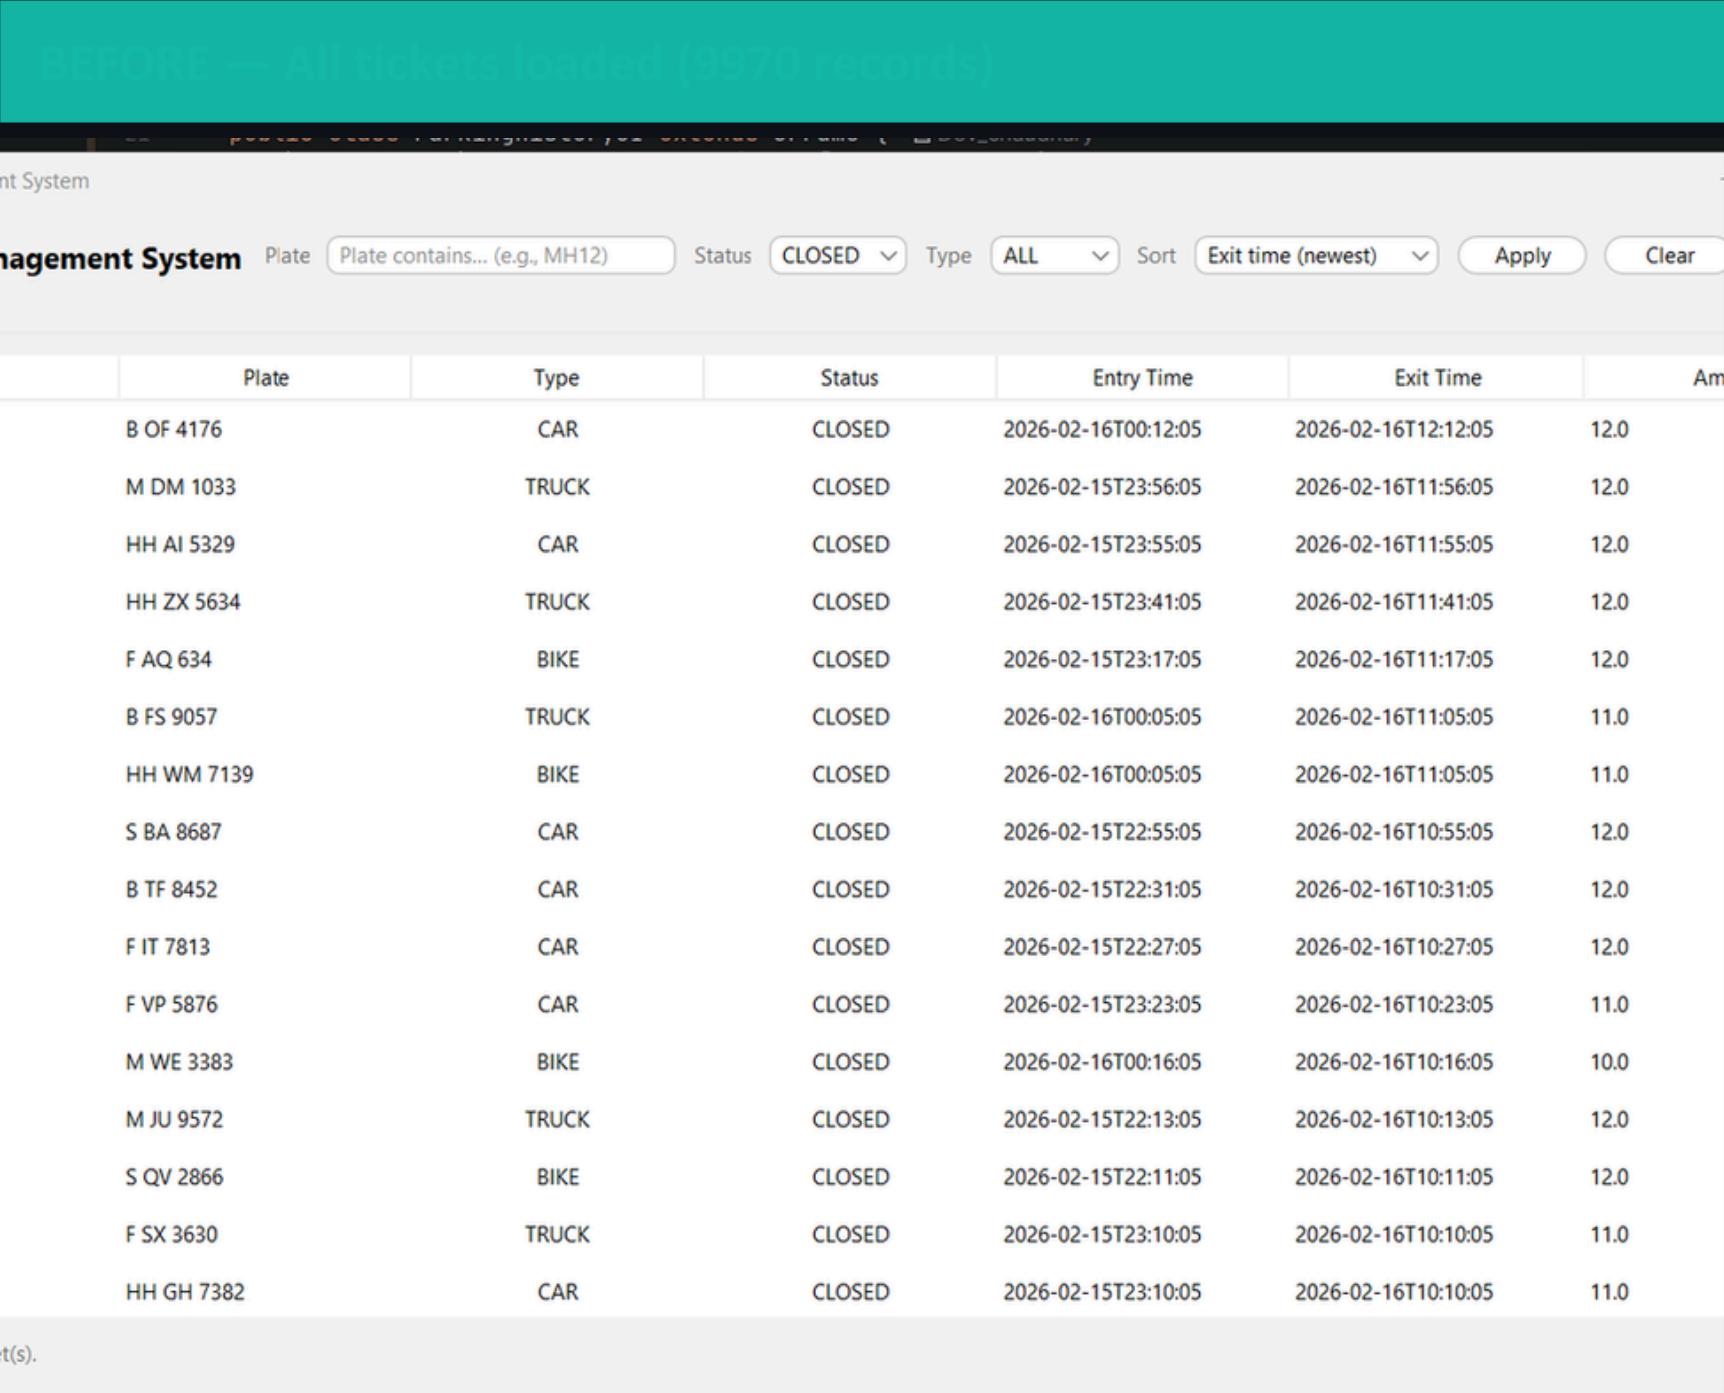

GET

/health

Returns: { "status": "UP" }

Server health check — used by Ping button in UI

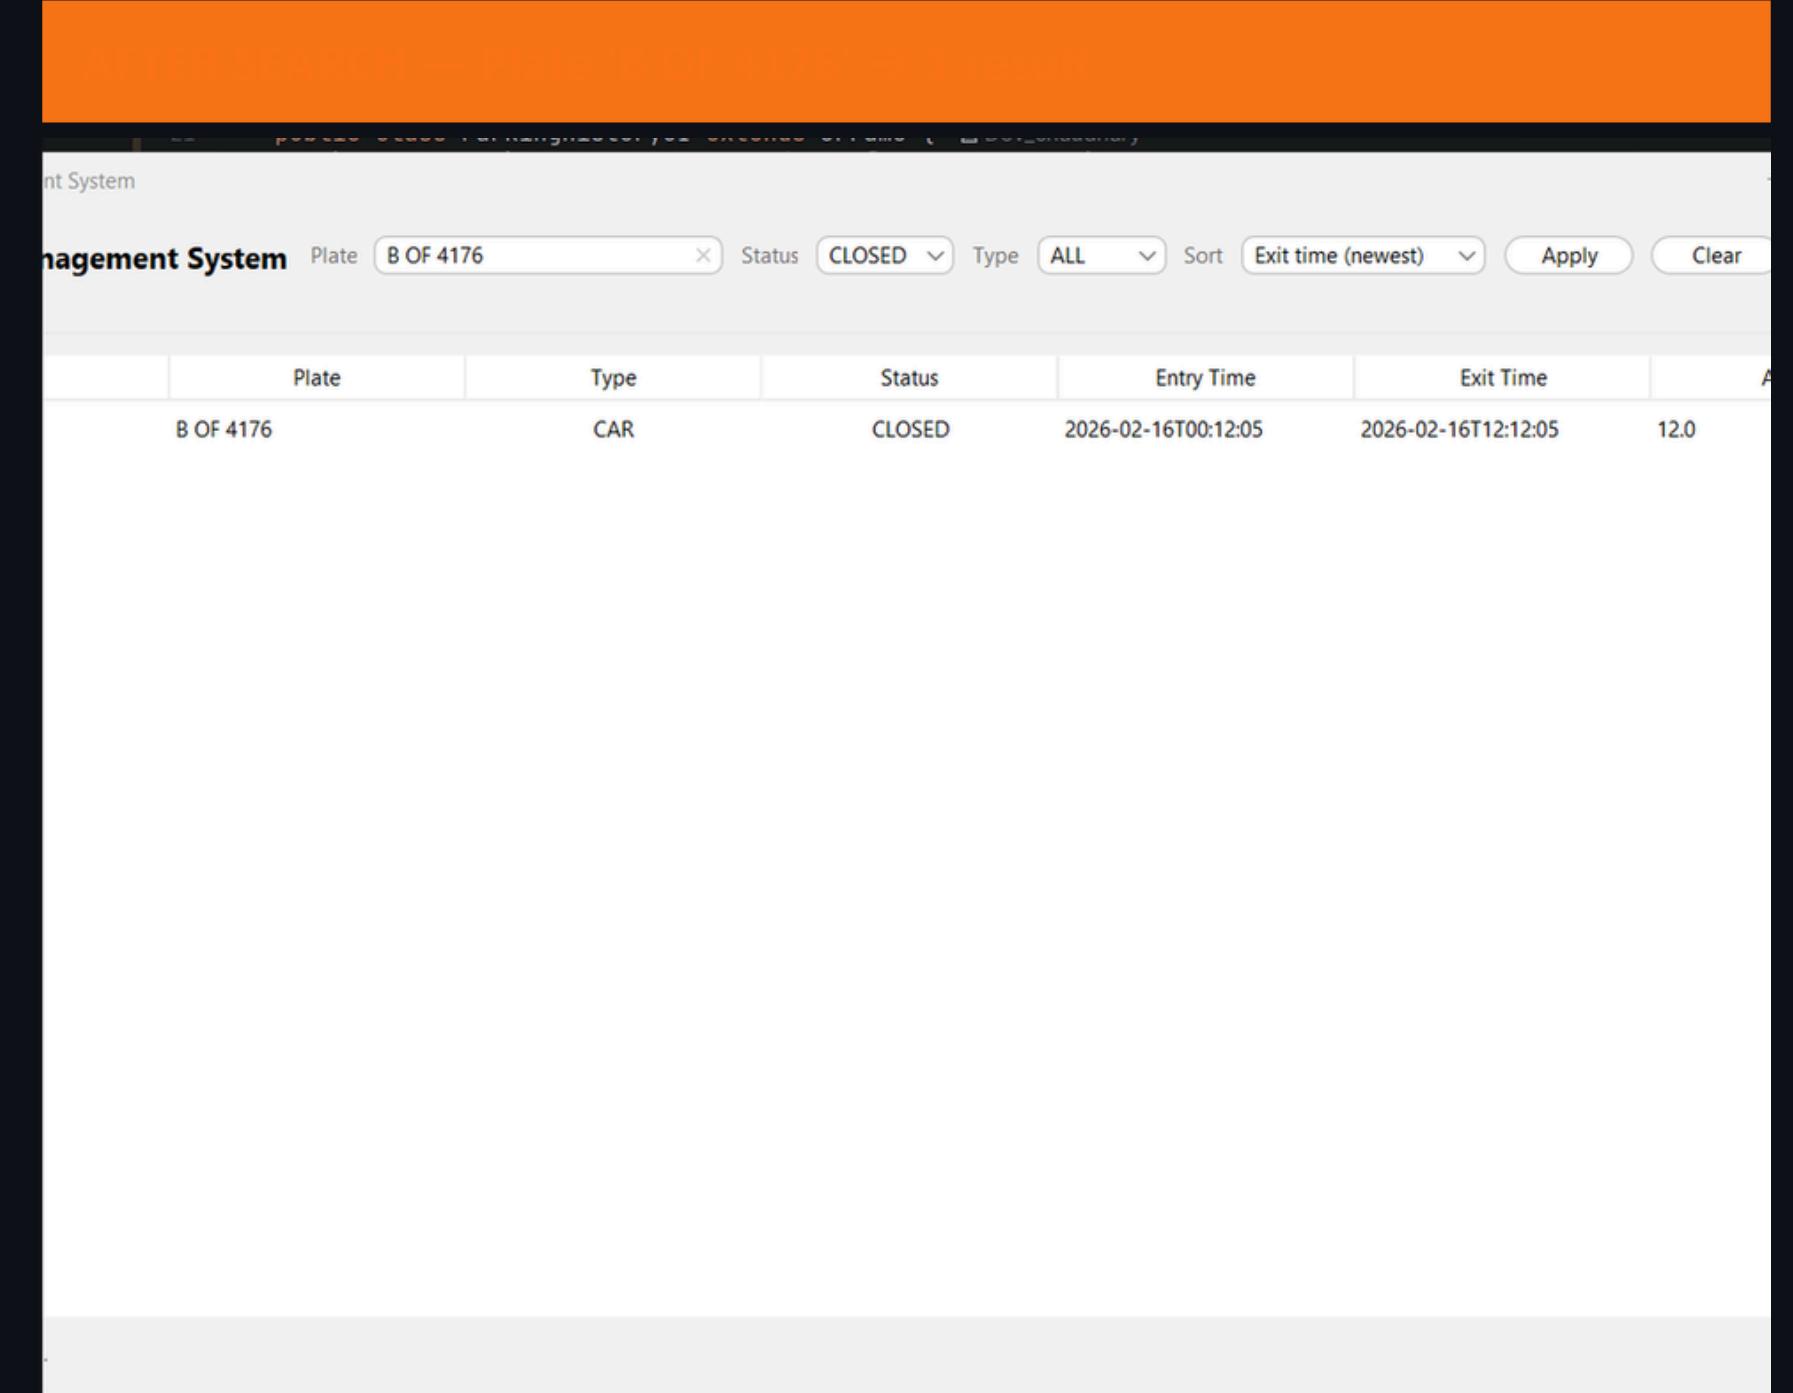

GUI Highlights – Actual System Screenshots

Management System

Plate: Plate contains... (e.g., MH12) Status: CLOSED Type: ALL Sort: Exit time (newest) Apply Clear

ID	Plate	Type	Status	Entry Time	Exit Time	Amount
	B OF 4176	CAR	CLOSED	2026-02-16T00:12:05	2026-02-16T12:12:05	12.0

End-to-End Flow – Login to History View

LOGIN FLOW (AdminLoginUI.java)

HISTORY VIEW FLOW (ParkingSwingUI.java)

OOP Concepts in This Project

Encapsulation

All fields in Ticket.java are private — accessed only through getters/setters. The backend hides the MySQL database entirely from the Swing frontend.

Polymorphism

VehicleType enum (CAR, BIKE, TRUCK, OTHER) — each is a distinct polymorphic value. ThrowingSupplier functional interface overrides the standard Supplier behavior.

Inheritance

AdminLoginUI extends JFrame (login window). ParkingSwingUI extends JFrame (dashboard). TicketRepository extends JpaRepository — inherits all CRUD methods.

Abstraction

JpaRepository hides all SQL. HttpClient hides HTTP socket details. runAsync() hides threading complexity. Each layer exposes only what is needed.

Thank You

Parking Management System
